### Other Site Characteristics

Nuovo habitat proposto di interesse regionale codice CORINE 22.4311, sup.coperta 11% della superficie del sito. Rappresentatività B, sup.relativa C, grado conservazione B, valutazione globale B.

### 4.2 Quality and importance

Risulta essere uno degli ultimi lembi di ambiente palustre nella Pianura bresciana. Riveste un importante ruolo per l'avifauna sia stanziale sia migratoria. È luogo preferenziale per la nidificazione di molte specie palustri. E' inoltre un ambiente idoneo alla riproduzione di anfibi e rettili. Il sito si presenta come un mosaico di specchi d'acqua alternati a vecchi camminamenti su cui è presente una vegetazione naturale sia erbacea che arborea in parte alterata dall'ingresso di specie vegetali alloctone di origine nordamericana. Il resto dell'area è per gran parte occupato da ampie plaghe di vegetazione palustre, cariceti e magnocariceti, che caratterizzano marcatamente l'ambiente della Riserva. Gli specchi d'acqua, nelle parti meno profonde, sono occupate da un lamineto improntato essenzialmente a *Nymphaea alba*.
